

Team Text - Software Architecture Overview

Introduction

This document presents the wider architecture developed by Team Text at the KNAW Humanities Cluster. All in-house software mentioned in this documentation can be found via <https://tools.huc.knaw.nl>.

The document serves both as an internal reference, as well as a technical showcase to external parties.

1. Service Oriented Architecture for Text Collections

We have ample experience publishing diverse scientific text collections. These may be literary text editions, historical manuscripts, linguistically-annotated collections or large corpora from automatic OCR or Handwritten Text Recognition.

3. Data Enrichment pipelines

Most data enrichment pipelines are documented elsewhere (direct links to schemas or READMEs):

- Globalise Language Detection pipeline
- Globalise Query Expansion pipeline (kweeper)

4. Data Models

Data models can be found elsewhere as well (direct links to schemas or READMEs/documentation with schemas):

- STAM
- Text Fabric
- FoLiA
